

Customer information – change in the surface treatment of brass fittings FV – Plast, a.s.

Dear business partners,

We would like to inform you that FV – Plast, a.s. will gradually transition to a new surface treatment for brass components in our combined fittings over the course of the next year.

Instead of the nickel-plated finish used to date, fittings will now be manufactured with a non-nickel-plated surface.

This change is in response to upcoming European legislation, which is highly likely expected to come into effect in 2027.

- The high quality of the fittings remains guaranteed
- The technical parameters of the products remain unchanged
- The surface treatment has no effect on installation procedures or the length of the system warranty
- The change only affects the appearance of the brass parts – the original silver tone will be replaced by a golden one

During 2026, both variants may appear concurrently in deliveries.

This transitional situation has no impact on the functionality, safety, or quality of the entire system.

Both variants of fittings can be combined without limitations.

Your Sales team
